### Question Statement 🔴 [🔥 MUST-SOLVE | INFOSYS SE ACTUAL PATTERN]

> 🎯 **Exam Priority:** 🔴 [🔥 MUST-SOLVE / HIGH RECURRENCE]
> 📊 **Target Difficulty:** `Infosys SE Standard Level` (Single/Double Step Deduction)
> 💡 **Preparation Advice: MANDATORY FOR 5-6 NOV DRIVE** (Direct recurring exam concept)

/ Code Snippet

```
#include<iostream>
using namespace std;
class Test {
static int x;
public:
Test() { x++; }
static int getX() { return x; } };
int Test::x=0;
int main() {
cout<< Test::getX()<<“ “;
Test t[5];
cout<< Test::getX(); }
```

### Options

- a) 0 0
- b) 5 5
- c) 0 5
- d) Run time error

### Correct Answer

> [!IMPORTANT]
> **Verified Answer Key**: `Option C`

### Step-by-Step Code Execution Trace & Proof

1. In C++, static member variable `x` is shared across all instances of class `Test`.
2. Initially `Test::x = 0`. The first print `Test::getX()` outputs `0`.
3. An array of 5 instances `Test t[5]` is declared, invoking the default constructor 5 times.
4. Each constructor invocation increments `x` ( `x++` ), so `x` becomes 5.
5. The second print `Test::getX()` outputs `5`.
   Therefore, the output is `0 5` (Option C).

> 🎯 **Exam Priority:** 🔴 [🔥 MUST-SOLVE / HIGH RECURRENCE]
> 📊 **Target Difficulty:** `Infosys SE Standard Level` (Single/Double Step Deduction)
> 💡 **Preparation Advice: MANDATORY FOR 5-6 NOV DRIVE** (Direct recurring exam concept)

/ Code Snippet

```
#include<iostream>
using namespace std;
class Point {
Point()
 { cout<<“Constructor called”; }
};
int main()
{
Point t1;
return 0;
}
```

### Options

- a) Constructor called
- b) Compile time error
- c) Run time error
- d) Blank line

### Correct Answer

> [!IMPORTANT]
> **Verified Answer Key**: `Option B`

### Step-by-Step Code Execution Trace & Proof

1. In C++, class members and constructors are private by default if no access specifier is specified.
2. `class Point { Point() { ... } };` declares a private constructor.
3. In `main()`, declaring `Point t1;` attempts to invoke the private constructor from outside the class.
4. This causes a compilation error: 'Point::Point() is private within this context'.
   Therefore, the result is `Compile time error` (Option B).

```

### Options

- a) 0
- b) Not a Number
- c) Infinity
- d) Run time exception

### Correct Answer

> [!IMPORTANT]
> **Verified Answer Key**: `Option C`

### Step-by-Step Code Execution Trace & Proof

In Java, floating-point arithmetic follows IEEE 754 standards. Dividing a non-zero float/double by 0 or 0.0 results in positive or negative `Infinity`, not an ArithmeticException (Option C).
