Part 1: Enterprise Reading Comprehension Passages (Papers 01 to 07)

Reading Comprehension Passage — Paper 01

```
Read the passage and answer Q26–30.
In software organisations, "technical debt" is often treated as a purely engineering concern, a messy residue of hurried decisions that developers will eventually tidy up. This framing is misleading. Debt, in the financial sense, is not inherently harmful; a company that borrows to seize a market opportunity may be acting shrewdly. The problem arises when the interest, meaning the extra effort every future change demands, is never acknowledged on the balance sheet. Teams then find that features which once took days now take weeks, yet managers, seeing only the delivered functionality, attribute the slowdown to declining developer productivity. Proponents of disciplined refactoring argue that a fixed share of every sprint should be reserved for repayment. Critics counter that such quotas are arbitrary and encourage cosmetic rewrites that leave real risks untouched. A more defensible approach, some suggest, is to make debt visible by tracking how often particular modules cause delays or defects, and to repay only where the interest is demonstrably high.
```

Reading Comprehension Passage — Paper 02

```
Read the passage and answer Q26–30.
Automation in enterprise software is frequently sold on the promise of eliminating human error, yet the more interesting effect is often a redistribution of error rather than its removal. When a system automates data entry, the mistakes that once occurred at the point of typing largely disappear, but new failure modes emerge upstream, in the design of the rules the automation follows, and downstream, in the operators' declining vigilance once they trust the system implicitly. A well-documented pattern in aviation and, increasingly, in IT operations is that highly reliable automation breeds complacency: engineers stop cross-checking outputs precisely because the system rarely errs, so on the rare occasion it does, the mistake propagates further before anyone notices. This does not argue against automation; it argues for designing monitoring and escalation processes that assume the automation will occasionally fail silently, rather than processes that assume a human will always catch what the machine misses.
```

Reading Comprehension Passage — Paper 03

```
Software effort estimation has resisted four decades of methodological refinement, and the reason is not, as often supposed, a lack of adequate techniques. Function point analysis, story point velocity tracking and Monte Carlo simulation are all, in controlled retrospective studies, reasonably well calibrated. The
```

persistent gap between estimated and actual delivery dates arises instead from a structural asymmetry: the costs of underestimating are diffuse and delayed, distributed across a project's eventual overrun, whereas the costs of overestimating are immediate and attributable, since a padded estimate can lose a bid or provoke management scrutiny before the work even begins. Estimators therefore face an incentive gradient that has nothing to do with statistical accuracy and everything to do with organisational consequence, and this gradient reliably pushes estimates toward optimism regardless of how sophisticated the underlying model is. Attempts to correct this by adding explicit contingency buffers frequently fail for a related reason: once a buffer becomes visible in a schedule, it is treated by stakeholders as slack to be reclaimed rather than risk to be reserved, a phenomenon sometimes called the student syndrome, in reference to the tendency to begin a task only as its deadline approaches.

Reading Comprehension Passage — Paper 04

Read the passage and answer Q26–30.
Distributed systems theory offers a deceptively simple trilemma: a system cannot simultaneously guarantee consistency, availability and partition tolerance, and must therefore sacrifice one when a network partition occurs. In practice, however, the theorem is more often invoked than correctly applied, because partition tolerance is not actually optional for any system whose nodes communicate over an unreliable network, which is to say nearly all distributed systems built today. The real choice, once partition tolerance is accepted as a structural necessity rather than a design preference, is between consistency and availability during the partition itself, and this choice need not be uniform across an entire system. A payment ledger might reasonably refuse writes during a partition to preserve consistency, accepting temporary unavailability as the lesser cost, while a product catalogue serving read traffic might instead continue answering requests with potentially stale data, judging availability the more valuable property for that workload. Treating the CAP theorem as prescribing a single, system-wide

choice, rather than a per-operation or per-service one, is therefore a common and consequential misreading.

Reading Comprehension Passage — Paper 05

Read the passage and answer Q26–30.
Rate limiting is often presented as a purely defensive mechanism, a way to shield backend services from abusive or accidental traffic spikes, but this framing understates its role as a tool for communicating capacity contracts between services. A token-bucket limiter that rejects requests once a quota is exhausted is, in effect, declaring an explicit promise about how much load a downstream service can absorb, and client-side code written against that promise can make informed decisions about retry timing, backoff, and degraded functionality rather than failing unpredictably. The trouble arises when limits are set reactively, in response to an incident, rather than derived from actual capacity testing; a

limit chosen under pressure to stop an ongoing outage often reflects the conditions of that specific incident rather than the service's true sustainable throughput, and may be far too conservative once normal operation resumes, quietly capping legitimate growth long after the original emergency has been forgotten. Treating rate limits as living documentation of measured capacity, revisited whenever the underlying service's performance characteristics change, avoids both failure modes: the limiter protects the service without becoming an invisible ceiling on its own success.

Reading Comprehension Passage — Paper 06

Read the passage and answer Q26–30.
When a measure becomes a target, it ceases to be a good measure — a maxim known as Goodhart's law

```
that engineering organisations rediscover with remarkable regularity. A team told that its performance
will be judged by the number of closed tickets quickly learns to split large tasks into many trivial ones; a
group rewarded for code coverage writes tests that execute lines without asserting anything meaningful.
In neither case is the behaviour necessarily cynical. People respond rationally to the incentives they
perceive, and the metric, once elevated to a goal, simply redirects that rationality away from the outcome
it was intended to track. The remedy is not to abandon measurement, which would leave managers
navigating by anecdote, but to treat any single metric as a symptom rather than a verdict, to pair it with
a counter-metric that penalises its obvious abuse, and to revisit the pairing as teams learn how to game
it. Even then, the arrangement is only ever provisionally sound, since every safeguard becomes, in time,
another target.

Reading Comprehension Passage — Paper 07

```
Read the passage and answer Q26–30.
In distributed systems, a network call that times out leaves the caller in genuine ignorance: the request
may have been lost before reaching the server, executed successfully with the reply lost on the way back,
or still be in flight. Retrying is the natural response, but retrying a non-idempotent operation — charging
a card, say — risks performing it twice. The standard remedy is to make the operation idempotent by
attaching a unique request identifier, so that the server can recognise a duplicate and return the original
result instead of re-executing. This shifts the burden rather than removing it: the server must now durably
remember identifiers, and must decide how long to remember them, since storing them forever is costly
while discarding them too early reopens the window for duplicates. Engineers who treat idempotency as
a mere implementation detail therefore tend to discover it as an incident, whereas those who treat it as
part of an operation's contract design it in from the start.

Part 2: Verbal Ability Questions and Explanations (Q26 to Q45)

Question ITM-P01-Q26 (Infosys System Engineer ITM Mock Paper 1 - Q26)

Section: Section 3: Verbal Ability | **Page:** 3
Visual Reference Plate: paper_01_page_03.png

Question Text:
The central idea of the passage is that:

Options:
- **(A)** Technical debt is harmful and must be eliminated at once
- **(B)** Technical debt is not necessarily bad, but its recurring costs must be made visible and repaid selectively
- **(C)** Managers, not developers, are responsible for technical debt
- **(D)** Fixed refactoring quotas are the best way to manage debt

Correct Answer: Option **(B)** — `Technical debt is not necessarily bad, but its recurring costs must be made visible and repaid selectively`

Detailed Derivation & Solution (Grammatical & Textual Justification):

The passage argues that technical debt is analogous to financial debt: not inherently evil, but dangerous when its recurring carrying costs ('interest') are unacknowledged. The recommended path is making debt visible and repaying it where interest is demonstrably high, matching option (b).

Question ITM-P01-Q27 (Infosys System Engineer ITM Mock Paper 1 - Q27)

Section: Section 3: Verbal Ability | **Page:** 3
Visual Reference Plate: paper_01_page_03.png

Question Text:
According to the passage, managers blame developer productivity because they:

Options:
- **(A)** do not trust developers
- **(B)** see only the delivered features and not the hidden extra effort
- **(C)** are unaware that software can be refactored
- **(D)** have reserved too little time for sprints

Correct Answer: Option **(B)** — `see only the delivered features and not the hidden extra effort`

Detailed Derivation & Solution (Grammatical & Textual Justification):

The passage states explicitly: 'yet managers, seeing only the delivered functionality, attribute the slowdown to declining developer productivity.' Because the background drag of unrecorded debt is invisible to them, they blame the engineers.

Question ITM-P01-Q28 (Infosys System Engineer ITM Mock Paper 1 - Q28)

Section: Section 3: Verbal Ability | **Page:** 4
Visual Reference Plate: paper_01_page_04.png

Question Text:
Which statement would critics of fixed repayment quotas most likely agree with?

Options:
- **(A)** Repayment effort should target genuine risks rather than meet a set proportion
- **(B)** Refactoring should be abandoned entirely
- **(C)** Cosmetic rewrites are the most valuable form of repayment
- **(D)** Sprints should be lengthened

Correct Answer: Option **(A)** — `Repayment effort should target genuine risks rather than meet a set proportion`

Detailed Derivation & Solution (Grammatical & Textual Justification):

Critics argue that fixed quotas 'are arbitrary and encourage cosmetic rewrites that leave real risks untouched.' Hence, they would advocate targeting repayment where high, genuine risks exist rather than meeting a rigid percentage.

Question ITM-P01-Q29 (Infosys System Engineer ITM Mock Paper 1 - Q29)

Section: Section 3: Verbal Ability | **Page:** 4
Visual Reference Plate: paper_01_page_04.png

Question Text:
In the passage, "interest" most nearly refers to:

Options:
- **(A)** money paid to lenders
- **(B)** the recurring additional effort imposed on future changes
- **(C)** the curiosity of developers
- **(D)** the profit from a market opportunity

Correct Answer: Option **(B)** — `the recurring additional effort imposed on future changes`

Detailed Derivation & Solution (Grammatical & Textual Justification):

The passage defines interest directly: 'the interest, meaning the extra effort every future change demands'.

Question ITM-P01-Q30 (Infosys System Engineer ITM Mock Paper 1 - Q30)

Section: Section 3: Verbal Ability | **Page:** 4
Visual Reference Plate: paper_01_page_04.png

Question Text:
Which of the following is NOT supported by the passage?

Options:
- **(A)** Borrowing can sometimes be a shrewd decision
- **(B)** A slowdown in delivery always indicates falling developer productivity
- **(C)** Tracking defect-prone modules can help identify costly debt
- **(D)** Debt is often left unrecorded in practice

Sentence Correction (Q31–35). Choose the best replacement for the bold part.

Correct Answer: Option **(B)** — `A slowdown in delivery always indicates falling developer productivity`

Detailed Derivation & Solution (Grammatical & Textual Justification):

The passage explicitly notes that a delivery slowdown is often caused by accumulated technical debt rather than declining developer productivity, so the claim that slowdown 'always indicates falling developer productivity' is false and NOT supported.

Question ITM-P01-Q31 (Infosys System Engineer ITM Mock Paper 1 - Q31)

Section: Section 3: Verbal Ability | **Page:** 4
Visual Reference Plate: paper_01_page_04.png

Question Text:
Neither the manager nor the engineers was aware of the revised deadline.

Options:
- **(A)** No improvement
- **(B)** engineers were
- **(C)** engineers has been
- **(D)** engineer were

Correct Answer: Option **(B)** — `engineers were`

Detailed Derivation & Solution (Grammatical & Textual Justification):

With correlative conjunctions 'neither... nor', the verb agrees in number with the nearer subject. Here, the nearer subject is 'engineers' (plural), which requires the plural past verb 'were'. Correct: 'Neither the manager nor the engineers were aware of the revised deadline.'

Question ITM-P01-Q32 (Infosys System Engineer ITM Mock Paper 1 - Q32)

Section: Section 3: Verbal Ability | **Page:** 4
Visual Reference Plate: paper_01_page_04.png

Options:
- **(A)** No improvement
- **(B)** Had the team tested
- **(C)** Has the team tested
- **(D)** If the team would test

Correct Answer: Option **(B)** — `Had the team tested`

Detailed Derivation & Solution (Grammatical & Textual Justification):

Inverted third conditional structure uses 'Had + subject + past participle'. The conditional clause cannot contain 'would have'. Correct: 'Had the team tested the patch thoroughly, the outage could have been avoided.'

Question ITM-P01-Q33 (Infosys System Engineer ITM Mock Paper 1 - Q33)

Section: Section 3: Verbal Ability | **Page:** 4
Visual Reference Plate: paper_01_page_04.png

Question Text:
Hardly the server had restarted when the alerts began flooding in.

Options:
- **(A)** No improvement
- **(B)** had the server restarted when
- **(C)** did the server restarted when
- **(D)** the server
restarted than

Correct Answer: Option **(B)** — `had the server restarted when`

Detailed Derivation & Solution (Grammatical & Textual Justification):

Negative adverbial 'Hardly' placed at the beginning of a clause triggers negative inversion: 'Hardly had + subject + past participle... when...'. Correct: 'Hardly had the server restarted when the alerts began flooding in.'

Question ITM-P01-Q34 (Infosys System Engineer ITM Mock Paper 1 - Q34)

Section: Section 3: Verbal Ability | **Page:** 4
Visual Reference Plate: paper_01_page_04.png

Question Text:
The number of applicants are increasing, but a large number of them lacks the required skills.

Options:
- **(A)** are ... lacks
- **(B)** is ... lack
- **(C)** is ... lacks
- **(D)** are ... lack

Correct Answer: Option **(B)** — `is … lack`

Detailed Derivation & Solution (Grammatical & Textual Justification):

'The number of' denotes a singular collective quantity and takes a singular verb ('is increasing'). In contrast, 'a large number of' denotes a plural quantity of individuals and takes a plural verb ('lack the required skills'). Correct: 'is ... lack'.

Question ITM-P01-Q35 (Infosys System Engineer ITM Mock Paper 1 - Q35)

Section: Section 3: Verbal Ability | **Page:** 4
Visual Reference Plate: paper_01_page_04.png

Question Text:

Options:
- **(A)** No improvement
- **(B)** was
- **(C)** are
- **(D)** have been

Para-jumbles (Q36–38). Arrange the sentences in the correct order.

Correct Answer: Option **(B)** — `was`

Detailed Derivation & Solution (Grammatical & Textual Justification):

The true grammatical subject of the sentence is 'Each' (distributive pronoun, singular). Parenthetical prepositional phrases like 'along with their mentor' do not alter the grammatical number of the subject. Correct: 'was'.

Options:
- **(A)** QRPS
- **(B)** QPRS
- **(C)** RQPS
- **(D)** QRSP

Correct Answer: Option **(A)** — `QRPS`

Detailed Derivation & Solution (Grammatical & Textual Justification):

Logical progression: Q introduces the subject ('Counterfactual questions... are popular with historians'), R defines their negative boundary ('They do not aim to predict...'), P introduces the positive counterpart ('Rather, they encourage people to think...'), and S summarizes their scholarly value ('Such speculation... can illuminate real events').
