- **(C)** were
- **(D)** are

Correct Answer: Option **(B)** — `has been`

Correct Answer: Option **(C)** — `will have completed`

Detailed Grammatical Rule & Rule Explanation:
The time marker 'By the time + simple present clause' ('the auditors arrive next month') establishes a deadline in the future before which another action will be completed, requiring Future Perfect tense ('will have completed').

Question ITM-P01-Q57 (Infosys System Engineer ITM Mock Paper 1 - Q57)

- **(B)** B
- **(C)** C
- **(D)** D

Correct Answer: Option **(C)** — `C`

- **(D)** An, a, the, an

Correct Answer: Option **(C)** — `-, the, -, the`

Detailed Grammatical Rule & Rule Explanation:
"Honesty" (abstract, general sense) takes no article; "the best policy" (superlative) takes "the"; "history" (general sense) takes no article; "the dishonest" (adjective used to denote a class of people) takes "the".
Section 7: Writing
Use the rubric above. A strong answer defines both scaling approaches, weighs cost, downtime, and elasticity trade-offs, and recommends horizontal scaling (with justification: unpredictable/spiky e-commerce traffic is better handled by elastically adding/removing servers than by repeatedly resizing a single machine, which has a hardware ceiling and often requires downtime).
Scoring guide

Award +1 per MCQ (Q1–59) and up to 10 for Q60. Aim to clear each section's cut-off separately, not just the total. This paper is intentionally harder than Papers 1 and 2 — a lower raw score here is normal; focus on understanding the multi-step reasoning in the explanations.

Section: Section 6: English Grammar | **Page:** 7
Visual Reference Plate: paper_04_page_07.png

- **(C)** goes, had gone
- **(D)** went, has gone

Correct Answer: Option **(A)** — `went, had gone`

Detailed Grammatical Rule & Rule Explanation:
The main reported event ("went down") takes simple past; the leak's undetected state, which existed before and up to that event, takes past perfect ("had gone undetected").

- **(C)** C
- **(D)** D

Correct Answer: Option **(D)** — `D`

- **(D)** An, the, -, an

Correct Answer: Option **(A)** — `-, the, -, the`

Detailed Grammatical Rule & Rule Explanation:
"Information technology" (general/abstract) takes no article; "the way we work" takes "the" (specific, fixed phrase); "access" (general) takes no article; "the internet" conventionally takes "the".
Section 7: Writing
Use the rubric above. A strong answer explains that microservices offer better independent scalability but introduce operational complexity (service discovery, distributed tracing, orchestration) that a small team with limited DevOps experience may struggle to run reliably, while internal modularisation keeps deployment simple but still improves maintainability. Given the stated constraints (8 engineers, limited DevOps experience), the well-justified recommendation is usually to modularise internally first and revisit microservices once the team's operational maturity grows.
Scoring guide
Award +1 per MCQ (Q1–59) and up to 10 for Q60. This paper is intentionally harder than Papers 1–3; a lower raw score is expected — focus on the reasoning in the explanations, especially the computationally-verified matchstick answer (Q51) and the multi-pass algorithm traces (Q48, Q49).

Section 7: Writing
Use the rubric above. A strong answer explains that write-through caching keeps the cache and database synchronised (higher consistency, lower risk of data loss, but higher write latency), while write-back caching is faster for writes but risks data loss or staleness if the cache fails before the asynchronous write completes. It should recommend write-through for the financial transactions API (consistency and durability are critical) and write-back for the "like" counter (eventual consistency is acceptable, and raw write throughput matters more).
Scoring guide
Award +1 per MCQ (Q1–59) and up to 10 for Q60. This paper is intentionally the hardest in the series — the matchstick puzzle (Q51) and several pseudo-code traces (Q46, Q50) were independently verified by running the logic in code, not just worked by hand, so trust the explanations even where the reasoning looks dense.

Section 7: Writing
Use the rubric above. A strong answer explains that round robin sends requests to servers in a fixed rotation regardless of their current load, while least connections sends each new request to the server with the fewest active connections. For requests of widely varying duration, least connections is the better choice, because round robin can pile long requests onto one server while others sit idle.
