SECTION 7 — ENGLISH WRITTEN TEST

1 Question | Evaluated | 10 Minutes

1. Write an essay of approximately 150–200 words on the following topic:
"Technology can improve productivity, but human skills remain essential in the modern workplace."

Corporate Model Essay (Score: 10/10)

Topic: *Technology can improve productivity, but human skills remain essential in the modern workplace.*

The rapid proliferation of artificial intelligence, enterprise automation, and cloud platforms has revolutionized the contemporary workplace, driving computational throughput and operational productivity to unprecedented heights. Routine administrative workflows, repetitive data ingestion, and standard code generation are now executed in seconds. However, this technological acceleration does not diminish human

importance; rather, it elevates distinctly human competencies into the primary determinants of organizational success.

While algorithmic systems excel at deterministic pattern recognition and high-volume data processing, they lack the context-sensitive judgment, moral discernment, and emotional intelligence required to navigate complex organizational landscapes. Strategic decision-making often involves competing ethical priorities, ambiguity, and incomplete information—scenarios where human experience, nuanced intuition, and empathetic negotiation are non-negotiable. Furthermore, customer relationship management and team mentorship rely fundamentally on genuine empathy, rapport, and mutual trust that no automated interface can emulate.

Moreover, disruptive innovation is fundamentally a human endeavor. Technology provides powerful analytical instruments, but the creative spark that identifies latent consumer needs and synthesizes divergent concepts into breakthrough products originates in the human imagination. High-performing engineering teams leverage automation to eliminate cognitive drudgery, freeing their bandwidth for higher-order problem framing, systems architecture, and adversarial stress-testing.

In conclusion, technology and human capability must not be viewed as adversarial substitutes, but as synergistic partners. Enterprise productivity reaches its zenith when state-of-the-art computational infrastructure is guided by human creativity, ethical stewardship, and interpersonal leadership. The future workplace belongs to organizations that harness technology to amplify—not replace—human ingenuity.
