Read the passage and answer Q26–30.
In software organisations, "technical debt" is often treated as a purely engineering concern, a messy residue of hurried decisions that developers will eventually tidy up. This framing is misleading. Debt, in the financial sense, is not inherently harmful; a company that borrows to seize a market opportunity may be acting shrewdly. The problem arises when the interest, meaning the extra effort every future change demands, is never acknowledged on the balance sheet. Teams then find that features which once took days now take weeks, yet managers, seeing only the delivered functionality, attribute the slowdown to declining developer productivity. Proponents of disciplined refactoring argue that a fixed share of every sprint should be reserved for repayment. Critics counter that such quotas are arbitrary and encourage cosmetic rewrites that leave real risks untouched. A more defensible approach, some suggest, is to make debt visible by tracking how often particular modules cause delays or defects, and to repay only where the interest is demonstrably high.
