- d) Process queue

Correct Answer

> [!IMPORTANT]
> **Verified Answer Key**: `Option B`

Step-by-Step Code Execution Trace & Proof

```
Who among the following can
block the running process?
```

Options

- a) Fork
- b) Read
- c) Down
- d) All of these

Correct Answer

> [!IMPORTANT]
> **Verified Answer Key**: `Option D`

Step-by-Step Code Execution Trace & Proof

A running process can be transitioned to the blocked (waiting) state by system calls that require I/O or wait on semaphores:
- `Read` causes process to block waiting for I/O completion.

- `Down` (P operation on a semaphore) blocks the process if semaphore count is <= 0.
- In some contexts, specific fork synchronization primitives may block. The question identifies all these mechanisms as capable of blocking a process (Option D).

/ Code Snippet

```
Which of the following does not
interrupt the running process?
```

Options

- a) Timer interrupt
- b) Device
- c) Power failure
- d) Scheduler process

Correct Answer

> [!IMPORTANT]
> **Verified Answer Key**: `Option D`

Step-by-Step Code Execution Trace & Proof

- Timer interrupts, device I/O interrupts, and power failure events are hardware/external interrupts that immediately preempt a running process.
- The `Scheduler process` is an OS software entity executed as a result of an interrupt; it is not an interrupt itself (Option D).
