Problem 01: Bitwise Operators & Logic 🔴 [🔥 MUST-SOLVE | INFOSYS SE ACTUAL PATTERN]

> 🎯 **Exam Priority:** 🔴 [🔥 MUST-SOLVE | INFOSYS SE ACTUAL PATTERN]
> 📊 **Target Difficulty:** `Infosys SE Standard Level` (Single/Double Step Deduction)
> 💡 **Preparation Advice: MANDATORY FOR 5-6 NOV DRIVE** (Direct recurring exam concept)
> **Question ID:** `SEC03_EBOOK_Q001` | **Source File:** `1. Pseudo Codes Technical ebook.pdf`

Question Statement:

/ Code Snippet

```
#include<iostream>
using namespace std;
class Test  {
static  int x;
public:
Test()   {    x++;    }
static int getX()  {   return x;    }   };
int Test::x=0;
int main()   {
cout<< Test::getX()<<“ “;
Test t[5];
cout<< Test::getX();      }
```

Options

- a) 0 0
- b) 5 5
- c) 0 5
- d) Run time error

Correct Answer

> [!IMPORTANT] **Verified Answer Key**: `Option C`

Step-by-Step Code Execution Trace & Proof

1. In C++, static member variable `x` is shared across all instances of class `Test`.
2. Initially `Test::x = 0`. The first print `Test::getX()` outputs `0`.
3. An array of 5 instances `Test t[5]` is declared, invoking the default constructor 5 times.
4. Each constructor invocation increments `x` (`x++`), so `x` becomes 5.

5. The second print `Test::getX()` outputs `5`. Therefore, the output is `0 5` (Option C).

> 🎯 **Exam Priority:** 🔴 [🔥 MUST-SOLVE | INFOSYS SE ACTUAL PATTERN]
> 📊 **Target Difficulty:** `Infosys SE Standard Level` (Single/Double Step Deduction)
> 💡 **Preparation Advice: MANDATORY FOR 5-6 NOV DRIVE** (Direct recurring exam concept)
> **Question ID:** `SEC03_EBOOK_Q002` | **Source File:** `1. Pseudo Codes Technical ebook.pdf`

Question Statement:

/ Code Snippet

```
#include<iostream>
using namespace std;
class Point    {
Point()
 {  cout<<“Constructor called”;   }
};
int main()
{
Point t1;
return 0;
}
```

Options

- a) Constructor called
- b) Compile time error
- c) Run time error
- d) Blank line

Correct Answer

> [!IMPORTANT] **Verified Answer Key**: `Option B`

Step-by-Step Code Execution Trace & Proof

1. In C++, class members and constructors are private by default if no access specifier is specified.
2. `class Point { Point() { ... } };` declares a private constructor.
3. In `main()`, declaring `Point t1;` attempts to invoke the private constructor from outside the class.
4. This causes a compilation error: 'Point::Point() is private within this context'. Therefore, the result is `Compile time error` (Option B).

/ Code Snippet

```
What does the expression float a =
35 / 0 return?
```

Options

- a) 0
- b) Not a Number
- c) Infinity
- d) Run time exception

Correct Answer

> [!IMPORTANT] **Verified Answer Key**: `Option C`

Step-by-Step Code Execution Trace & Proof

In Java, floating-point arithmetic follows IEEE 754 standards. Dividing a non-zero float/double by 0 or 0.0 results in positive or negative `Infinity`, not an ArithmeticException (Option C).
